TaskFlow doesn't need more traffic. It needs its value back.

A stricter, more operator-style turnaround plan

My call

Fix the leak first.
Then earn the right to scale.

Loom

https://www.loom.com/share/ec723b4fa73542679c644feae340f941

This is the sentence I would defend in the room.

- calculations
- source log

My operating rule: no extra spend before the numbers move.

Start here: the category is fine. The product is not.

If I had to summarize the case in one line: TaskFlow stopped earning repeat usage.

What is broken

Retention is the clearest signal: D30 fell from 12% to 5%, D90 from 6.5% to 2.3%, and paid churn rose to 18%.

Why it broke

The product feels stale: no major release in 8 months, worse ratings, weak collaboration, no offline mode, repetitive UI.

Why this matters

Downloads and MAU fell 42%, CPI rose 44%, and burn is still about $150k a month against $60k MRR.

My management call

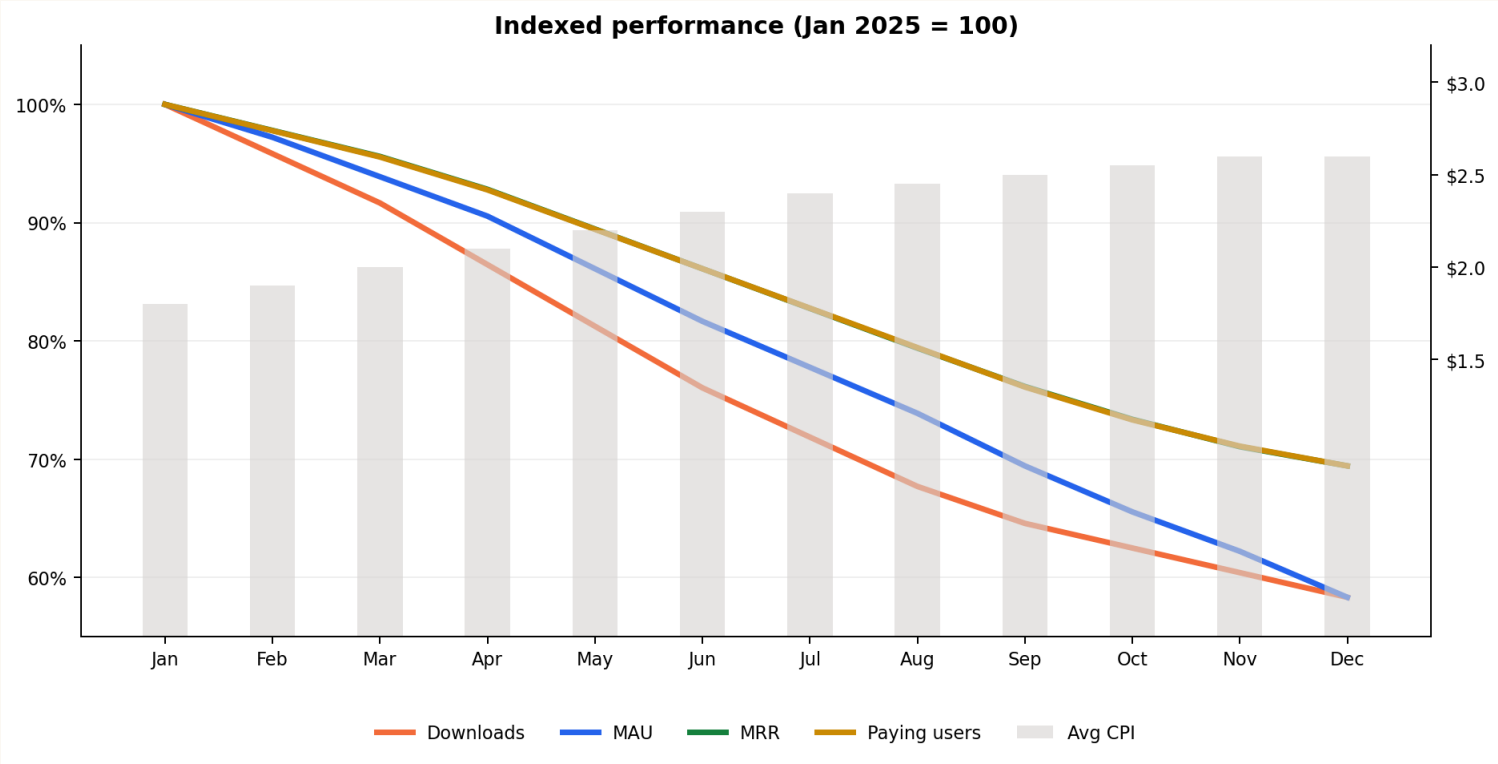
Do not fund a full pivot yet. Narrow the promise, fix first-session value, and scale only after the core numbers move.

Clearer promise. Better first-session value. Less paid dependence until retention recovers.

The real question is not "What else can we add?"
It is "Why would users come back tomorrow?"

Sources: Task brief; own calculations; Mordor; Gartner; competitor public pages.

The whole model bent in the same direction



Downloads

48k -> 28k
-42%

MAU

180k -> 105k
-42%

MRR

$86.4k -> $60.0k
-31%

Avg CPI

$1.80 -> $2.60
+44%

Sources: Task brief dataset; own calculations.

The leak starts after install

1. Retention broke first

Every cohort got weaker. D30 fell 58% and D90 fell 65% vs Q1 2024. That is what a value leak looks like.

2. The product stopped feeling fresh

Ratings fell from 4.6 to 4.2. Complaints repeat the same basics: weak collaboration, no offline mode, repetitive UI.

3. Paid growth became a patch

81% of installs are paid, and 62% come from Meta. That is too much dependence for a product with weakening retention.

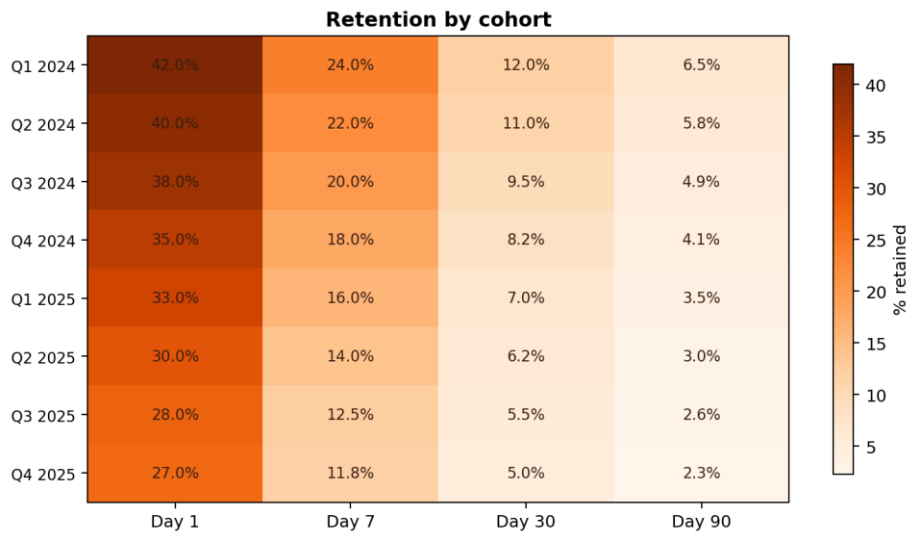
4. Cheap volume will not save it

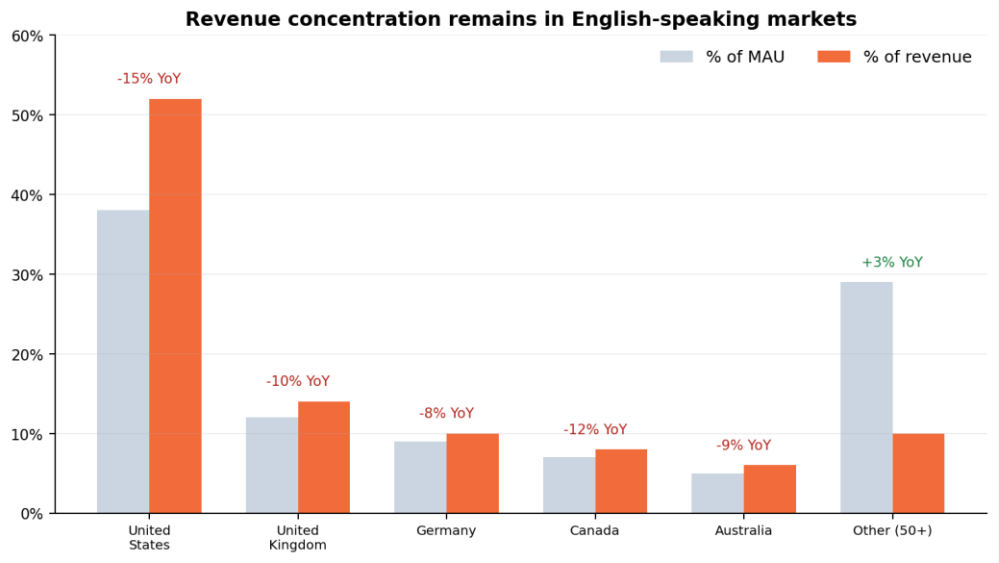
Other markets are 29% of MAU but only 10% of revenue. Cheaper installs there do not repair the model.

This is why I did not blame the market first.

Sources: Task brief dataset; public review themes from case prompt.

This is why buying more installs now is a trap





Approx. paid CAC

$26.5
= $2.60 / 9.8%

Approx. paid LTV

$26.7
= $4.80 / 18%

So what I would do

At today's conversion and churn, a newly acquired payer barely covers expected subscription value.

Operator rule

Cap weak paid social. Shift energy into activation, retention, ASO and content until the model improves.

Buying more traffic now mostly buys churn.

Sources: Task brief dataset; simplified LTV/CAC estimates using provided ARPPU, churn, CPI and free-to-paid conversion.

Where I still see upside

Demand still exists

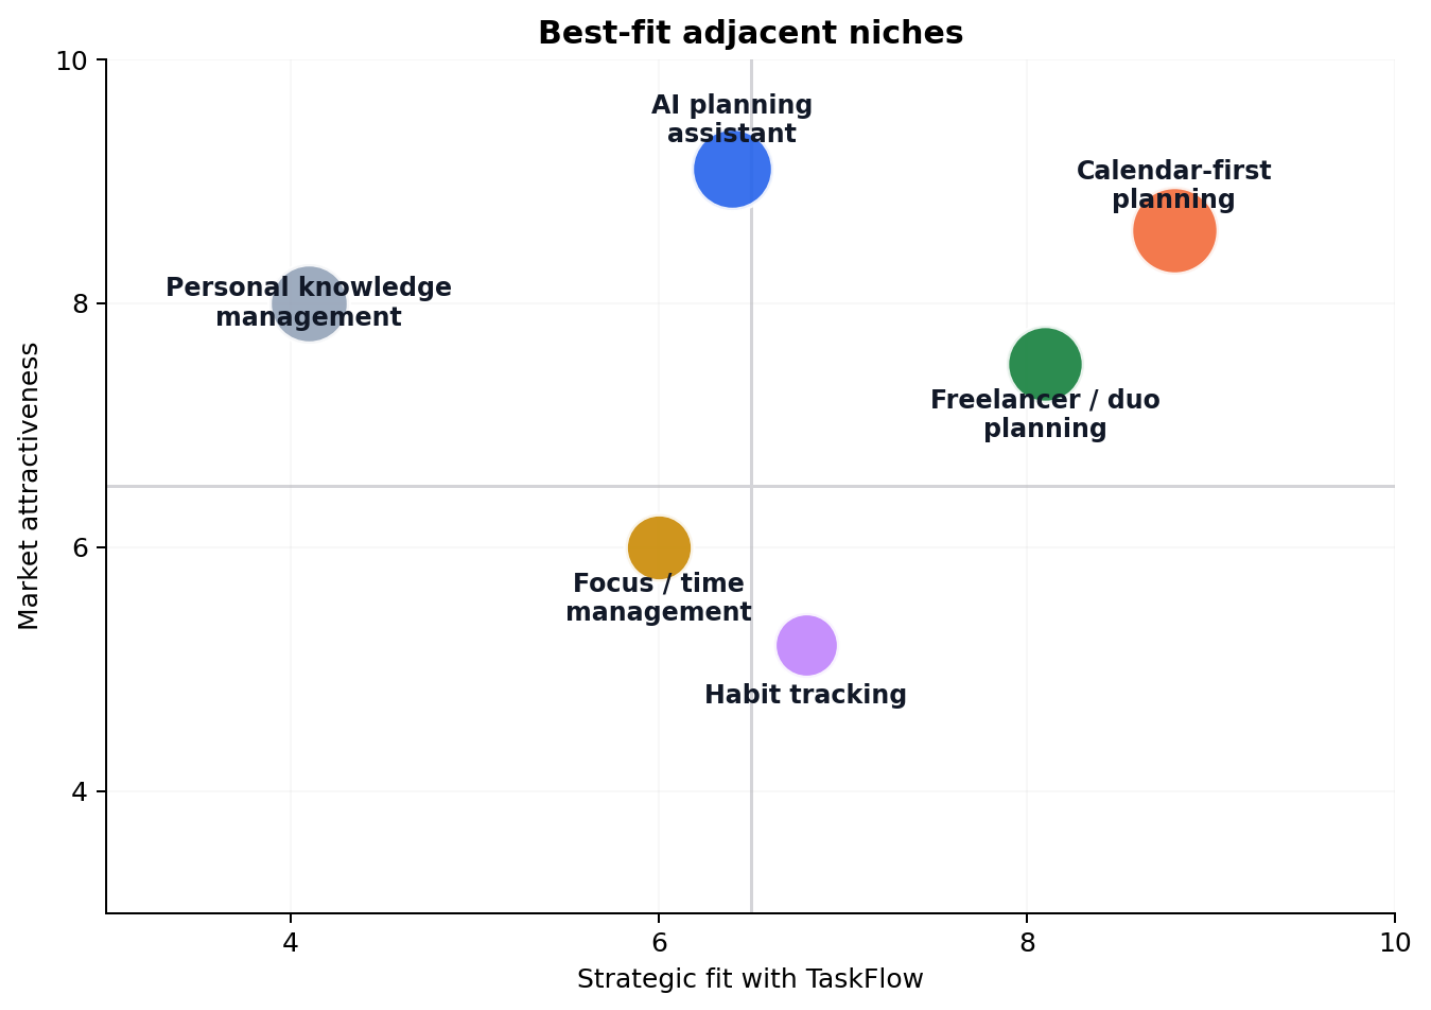
Task management is still growing. The question is not whether demand exists, but where TaskFlow can still win.

The best growth pocket

A narrower calendar-first planning use case fits the product better than generic to-do positioning.

Where I would focus first

US, UK, Canada and Australia already drive most revenue. I would fix the product there before chasing cheaper installs elsewhere.



Sources: Mordor Intelligence; TechCrunch on Sensor Tower State of Mobile 2026; Gartner AI predictions.

What stronger players do differently

TaskFlow today

Generic promise, weak collaboration, no offline mode, stale UX, too much paid dependence.

Todoist

Wins on templates, content and integrations. It feels easier to start for a concrete job to be done.

TickTick

Wins on bundled value: tasks, calendar, habits, focus tools and strong annual pricing.

Any.do

Wins on clearer shared-planning packaging through Family and Workspace flows.

Microsoft To Do

Wins distribution through Outlook and the Microsoft ecosystem, not just paid UA.

The practical lesson: TaskFlow needs a sharper promise, not a longer feature list.

Sources: Todoist, TickTick, Any.do and Microsoft To Do official pages + Google Play listings.

Where TaskFlow still has room to win

1. Faster first value

Onboarding, templates and calendar setup can make the product useful in the first session.

2. Better micro-collaboration

The opening is 2-5 person planning, not complex team workflows.

3. Less paid dependence

Competitors use templates, content, referrals and ecosystems. TaskFlow over-relies on paid social.

4. Product freshness

Shipping visible basics matters. Reviews suggest users no longer trust the product to keep improving.

The opening I would pursue

TaskFlow should not try to out-feature everyone. The opening is a cleaner calendar-first planner for solo professionals, freelancers and very small shared workflows.

This is narrow on purpose.

Sources: Competitor public pages and store listings; case prompt review themes.

I considered 3 paths.
Only one earns the right to scale.

Option A | Fix and narrow

Why I would say yes
Attacks the real leak, fits the current team, and can show progress inside 2-3 quarters.

Main downside
Requires discipline to stay narrow.

Option B | Full AI pivot

Why I would hesitate
Attractive theme, but it is a much bigger repositioning with higher product risk, stronger incumbents and extra cost.

Main downside
Too much uncertainty for the current runway.

Option C | Chase cheaper users

Why I would say no for now
It may improve install volume and headline CPI, but it does not solve retention and can weaken the revenue mix.

Main downside
Looks like growth without value.

My choice

Fix and narrow first. If the recovery stalls after Q3, reopen the pivot conversation from a stronger fact base.

Sources: Own strategic evaluation based on task brief, market data and competitor benchmark.

If I joined the team on Monday morning

Product

Rebuild the activation funnel.
Ship offline mode.
Tighten calendar parity.
Improve onboarding by use case.

Growth

Pause weak paid social.
Rewrite the store listing and landing page.
Build templates and creator pilots.

Customer insight

Run churn interviews.
Tag support tickets by reason.
Add cancellation survey.
Track D7 and D30 by cohort.

Support / success

Use lifecycle nudges for stuck trial users.
Build a self-serve help layer.
Turn support into a feedback loop, not only ticket handling.

Ops / finance

Freeze non-core work.
Use weekly stop-loss rules on paid.
Limit the team to 3 core bets at a time.

This is a sequencing plan, not a wishlist.

Same thesis, translated into owners.

Sources: Own recommendation based on brief, benchmark and market research.

Turnaround roadmap

Q2 2026 | Stop the bleed

Activation funnel
Offline mode MVP
Store listing rewrite
Paid stop-loss rules

Q3 2026 | Prove the core

Collaboration 2.0
Calendar parity
Templates
Free / trial experiments

Q4 2026 | Add AI selectively

Smart scheduling
Natural-language capture
Weekly planning summary

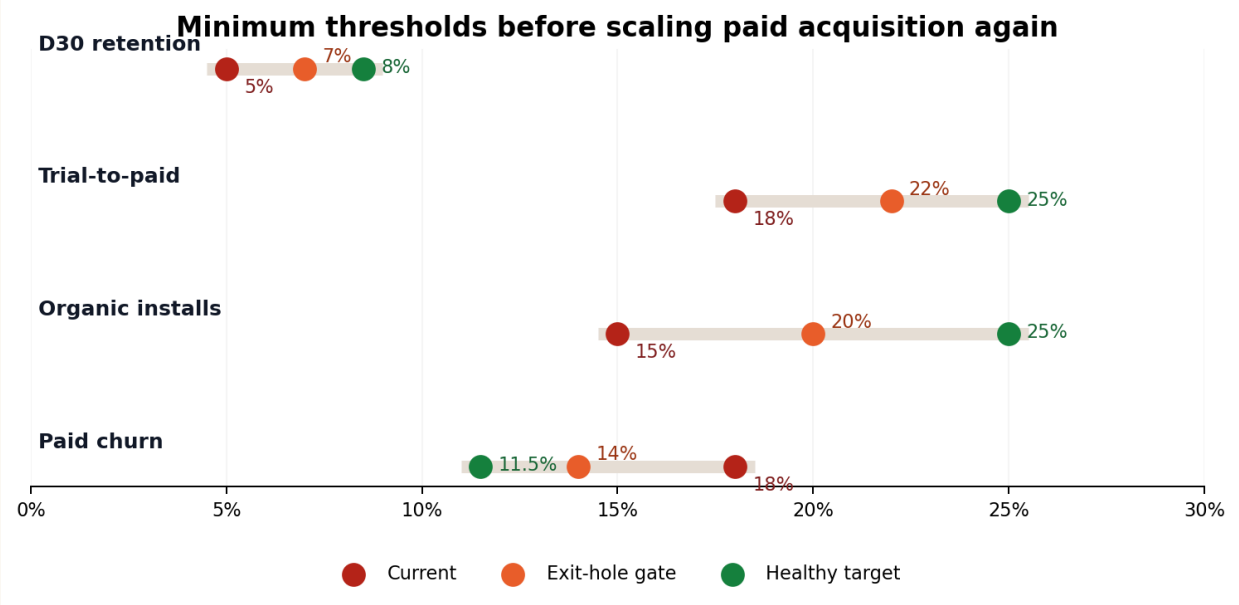
Q1 2027 | Scale winners

Increase spend only on green channels
Referral engine
Wave-2 market tests

My line in the sand: if D30 is still below 7% by the end of Q3, I would revisit a broader pivot.

Sources: Own roadmap recommendation.

Numbers I'd refuse to ignore before scaling again



Why these gates matter

They force the team to prove product value before buying more top-of-funnel volume.

Economic rule

Paid LTV / CAC should move above about 1.3x before spend increases materially; healthy state is 1.5x or better.

Decision rule

All operating gates should clear for 2 consecutive months before paid budgets go back up.

No cleared gates = no extra spend.

Sources: Own thresholds built from current baselines and simplified unit economics.

What success should feel like, not just look like

User value

D30 is back above 8%, ratings recover, and complaints about missing basics start fading.

Growth quality

Organic share rises, paid dependence falls, and channel decisions get cleaner.

Revenue quality

Lower churn and better trial conversion lift MRR without forcing a risky price cut.

Team cadence

Product, growth and support work from the same weekly scorecard instead of chasing disconnected fixes.

Strategic option value

Management can keep compounding the recovery or pivot later from a position of strength, not panic.

Sources: Own risk assessment.

Why these sources matter

Together, they show that the market is still healthy, competitors are raising the bar, and TaskFlow's problem is execution and positioning — not category decline.
